

Aerob Aerstar AAS U

Installable filter for conveyor systems with extreme negative pressure

- Standard model: up to -5,000 daPa
- Special model: up to -8,000 daPa

Vacuum conveyor systems with rotary piston compressors or vacuum pumps are extremely sensitive to air leakage.

For this particular problem, LTG AEROB has developed an **absolutely airtight filter** that can be integrated into separators. The robust welded construction in regular or stainless steel is built to withstand negative pressure of up to -5,000 daPa or even -8,000 daPa.

Construction

Robust, **completely airtight welded** construction in regular steel with maintenance access on the clean gas side and pipe connection to the conveyor system.

On request we can also supply parts in contact with product or a version made completely from stainless steel.
